

A decorative graphic on the left side of the slide. It consists of a blue parallelogram and a light green parallelogram, both tilted at an angle. The blue shape is in the foreground, and the green shape is partially behind it. They are set against a dark blue background with diagonal stripes.

# Math Structure Project

By: Patrick Stevens

# Groupings

You will split kids up into 4 groups with one group being the more advanced group then the second group will be second group of advanced kids. Then the third group will be kids that are struggling a little bit. Then the fourth group will be the kids who are really struggling and not meeting the standards.

# Math games

Math games can be utilized to make learning fun while engaging the student in work. This will help keep kids excited to learn and not get bored with it. Some games include any game with dice, shoots and ladders, except everyone spot they land on has a math problem they have to solve. Any board game can be converted into math game by adding numbers on spaces and having kids solve them.

# Worksheet Practice

This gives the students time to work on work by themselves and teaches them the gradual release of responsibility. It also gives them a chance to work on critical thinking and problem solving skills by themselves. This can be anything from adding to subtracting to word problems and more.

# Teacher Time

This part is for small group work with the teacher. This way the teacher has more time to focus on a particular kid or particular kids in the same skill group. This will give the time that students need to get some extra help. It is better to start with the struggling kids first so you do not run out of time.

# Online Work

With a constant changing world with technology in schools, teachers might as well utilize there tools and help exceed kids learning. Games like IXL, Prodigy and Moby Max are some games that can be utilized for students to help excel the kids learning.
